Installing the Graphical User Interface

The GUI is built as a single executable requiring no special DLLs. No installation program is required. The GUI.exe file simply needs to be copied onto the user's hard drive and optionally, a shortcut icon created on the desktop.

1. Copy the "GUI.EXE" program to your hard disk

It is recommended to install the GUI into its own directory since it writes its .ini file in that directory. Also, any trace files that are captured are written into this directory.

2. Run the GUI.EXE file

From the **START** menu select **"RUN"**. Specify the full path in the **"Open:"** box or use the browse function to find the GUI.EXE file. Click **"OK"**

3. Create a short cut

To create a shortcut icon created on the desktop, right-click and drag the GUI.EXE file to the desktop and select "Create Shortcut Here" from the popup menu.
